The H-J Family of Companies

Basics of Forgings and Castings

Rev 01

Authors: Patrick Meyer (patrickm@h-j.com), Bill Garber (billg@h-j.com)

Basics of Forgings and Castings Overview

- ▶ The H-J Family of Companies has extensive experience with forgings and castings in many ferrous and non-ferrous alloys such as copper, aluminum, stainless steel, etc.
- ▶ This presentation is intended to help educate customers about some of the basics types of forging and casting processes, as well as some of the advantages and disadvantages of each.
- ▶ Contact H-J for questions regarding:
 - ▶ New product development
 - ▶ Cost reduction projects
 - ▶ Quality and problem solving
 - ▶ Material and application evaluation

Overview of Forgings

**The H-J Family
of Companies**

Basics of Forgings and Castings

Forging process

- ▶ Basic steps include:
 - ▶ Cutting of the material
 - ▶ Pre-heat the forging dies
 - ▶ Heating of the material
 - ▶ Forging operation
 - ▶ Cooling of the forged part

Basics of Forgings and Castings

Forging process

What are typical forging temperatures?

- ▶ Ferrous metals
 - ▶ Carbon and Alloy Steel: 2,250° F (1,232° C)
- ▶ Non-ferrous metals
 - ▶ Brass: 1,500° F (816° C)
 - ▶ Copper: 1,650° F (899° C)
 - ▶ Aluminum: 1,000° F (538° C)

2000°F	Bright yellow	1093°C
1900°F	Dark yellow	1038°C
1800°F	Orange yellow	982°C
1700°F	Orange	927°C
1600°F	Orange red	871°C
1500°F	Bright red	816°C
1400°F	Red	760°C
1300°F	Medium red	704°C
1200°F	Dull red	649°C
1100°F	Slight red	593°C
1000°F	Very slight red, mostly grey	538°C
0800°F	Dark grey	427°C
0575°F	Blue	302°C
0540°F	Dark Purple	282°C
0520°F	Purple	271°C
0500°F	Brown/Purple	260°C
0480°F	Brown	249°C
0465°F	Dark Straw	241°C
0445°F	Light Straw	229°C
0390°F	Faint Straw	199°C

Basics of Forgings and Castings

Design considerations for Forgings

- ▶ Parting line location
- ▶ Recommended draft angles
 - ▶ Aluminum: 0-2 deg
 - ▶ Copper alloys (Brass): 0-3 deg
 - ▶ Steel: 5-7 deg
- ▶ Size of the part
- ▶ Part configuration
- ▶ Radii and Fillets
 - ▶ No sharp corners
 - ▶ Minimum fillet radius:
 - ▶ 0.130 - 0.250" (3.30 - 6.35 mm)
- ▶ Machine allowance
 - ▶ Typically 0.060" (1.52 mm)

Overview of Castings

**The H-J Family
of Companies**

Basics of Forgings and Castings

Casting processes

- ▶ Sand casting
- ▶ Permanent mold casting
- ▶ Die casting
- ▶ Investment (lost-wax) casting

**The H-J Family
of Companies**

Basics of Forgings and Castings

Sand casting

- ▶ Sand castings offer very competitive tooling costs (upfront investment)
- ▶ Capabilities:
 - ▶ Hold max tolerances of $\pm 0.032''$ ($\pm 0.81\text{mm}$)
 - ▶ Thinnest section castable is $0.100''$ (2.54mm)
 - ▶ Surface finish is fair to good
 - ▶ May be part size restrictions
 - ▶ Good for all metal alloys
- ▶ Types:
 - ▶ Green sand:
 - ▶ less expensive, good for lower volumes
 - ▶ Sodium silicate:
 - ▶ higher quality, more repeatable for larger volumes

**The H-J Family
of Companies**

Basics of Forgings and Castings

Permanent mold casting

- ▶ Permanent mold tooling costs are slightly higher than sand cast, but still competitive
- ▶ Capabilities:
 - ▶ Hold max tolerances of $\pm 0.020''$ ($\pm 0.51\text{mm}$)
 - ▶ Thinnest section castable is $0.125''$ (3.17mm)
 - ▶ Surface finish is good
 - ▶ Very good for large part designs
 - ▶ Best for aluminum and copper base alloys
 - ▶ Low volume part cost is competitive

**The H-J Family
of Companies**

Basics of Forgings and Castings

Die casting

- ▶ Tooling costs are more expensive due to complexity
- ▶ Capabilities:
 - ▶ Hold max tolerances of $\pm 0.005''$ ($\pm 0.127\text{mm}$)
 - ▶ Thinnest section castable is $0.030''$ (0.76mm)
 - ▶ Surface finish is the best
 - ▶ Good for aluminum base alloys
- ▶ Competitiveness:
 - ▶ Most competitive method in very high volumes
 - ▶ Least competitive method in low volumes

**The H-J Family
of Companies**

Basics of Forgings and Castings

Investment casting

- ▶ Tooling costs are between permanent mold and die casting
- ▶ Capabilities:
 - ▶ Hold max tolerances of $\pm 0.015''$ ($\pm 0.38\text{mm}$)
 - ▶ Thinnest section castable is $0.063''$ (1.6mm)
 - ▶ Surface finish is good
 - ▶ Good for all ferrous and non-ferrous alloys
- ▶ Competitiveness:
 - ▶ Least competitive method in very high volumes
 - ▶ Mid-competitive method in low volumes

Case studies

**The H-J Family
of Companies**

Basics of Forgings and Castings

Case study: Copper forged fuse end

- ▶ Current process:
 - ▶ Copper sand casting, machined, silver-plated
- ▶ Issues:
 - ▶ Porosity and non-fill in critical areas
 - ▶ Not cost effective
- ▶ Resolution:
 - ▶ Copper forging, machined, silver-plated
- ▶ Conclusion:
 - ▶ Forging process supplying fully formed and solid part per print at a substantial cost reduction for the customer.

**The H-J Family
of Companies**

Basics of Forgings and Castings

Case study: Two-piece universal clamp

- ▶ Current process:
 - ▶ Brass upset forging, tin-plated
- ▶ Issues:
 - ▶ Part not meeting specified torque requirements
- ▶ Resolution:
 - ▶ Brass flat forging, tin-plated
- ▶ Conclusion:
 - ▶ Discovered that torque was being applied parallel to the grain and causing failures; changed direction of forging grain and solved the issue.
